

CHAPTER 4

Number Representation and Calculation

4.1

Our Hindu-Arabic System and Early Positional Systems

Objectives

1. Evaluate an exponential expression.
2. Write a Hindu-Arabic numeral in expanded form.
3. Express a number's expanded form as a Hindu-Arabic numeral.
4. Understand and use the Babylonian numeration system.
5. Understand and use the Mayan numeration system.

Our Hindu-Arabic Numeration System

An important characteristic is that we can write the numeral for any number, large or small, using only ten symbols called **digits**:

0, 1, 2, 3, 4, 5, 6, 7, 8, and 9

Hindu-Arabic numerals can be written in **expanded form**, in which the value of the digit in each position is made clear.

We can write 663 in an expanded form such that

$$\begin{aligned} 663 &= (6 \times 100) + (6 \times 10) + (3 \times 1) \\ &= (6 \times 10^2) + (6 \times 10^1) + (3 \times 1) \end{aligned}$$

Our Hindu-Arabic Numeration System

Hindu Arabic numeration system is called a *positional-value*, or *place-value*, system. The positional values in the system are based on the powers of ten:

$$\dots, 10^5, 10^4, 10^3, 10^2, 10^1, 1$$

Example: Writing Hindu-Arabic Numerals in Expanded Form

Write 3407 in expanded form.

Solution:

$$3407 = (3 \times 10^3) + (4 \times 10^2) + (0 \times 10^1) + (7 \times 1)$$

or

$$= (3 \times 1000) + (4 \times 100) + (0 \times 10) + (7 \times 1)$$

Example: Expressing a Number's Expanded Form as a Hindu-Arabic Numeral

Express the expanded form as a Hindu-Arabic numeral:
 $(7 \times 10^3) + (5 \times 10^1) + (4 \times 1)$.

Solution: We start by showing all powers of 10, starting with the highest exponent given. Any power left out is expressed as 0 times that power of ten.

$$\begin{aligned} & (7 \times 10^3) + (5 \times 10^1) + (4 \times 1) \\ &= (7 \times 10^3) + (0 \times 10^2) + (5 \times 10^1) + (4 \times 1) \\ &= 7054 \end{aligned}$$

The Babylonian Numeration System

Babylonian	∇	<
Hindu-Arabic	1	10

The place values in the Babylonian system use powers of 60. The place values are

..., 60^3 , 60^2 , 60^1 , 1.

$$60^3 = 60 \times 60 \times 60 = 216,000$$

$$60^2 = 60 \times 60 = 3600$$

The Babylonians left a space to distinguish the various place values in a numeral from one another.

Example: Converting from a Babylonian Numeral to a Hindu-Arabic Numeral

Write $\vee\vee \llvee \ll\vee\vee$ as a Hindu-Arabic numeral.

Solution: From left to right the place values are 60^2 , 60^1 , and 1.

$$(1 + 1) \times 60^2 + (10 + 1) \times 60^1 + (10 + 10 + 1 + 1) \times 1$$

Represent the numeral in each place as a familiar Hindu-Arabic numeral.

$$= (2 \times 60^2) + (11 \times 60^1) + (22 \times 1)$$

Multiply each Hindu-Arabic numeral by its respective place value.

$$= (2 \times 3600) + (11 \times 60) + (22 \times 1)$$

$$= 7200 + 660 + 22$$

Find the sum of these products

$$= 7882$$

The Mayan Numeration System

0	1	2	3	4	5	6	7	8	9
	•	••	•••	••••	—	•	••	•••	••••
10	11	12	13	14	15	16	17	18	19
≡	•	••	•••	••••	≡	•	••	•••	••••

The place values in the Mayan system are

..., 18×20^3 , 18×20^2 , 18×20 , 20, 1

$18 \times 20 \times 20 \times 20 = 144,000$

$18 \times 20 \times 20 = 7200$

$18 \times 20 = 360$

Numerals in the Mayan system are expressed vertically. The place value at the bottom of the column is 1.

Example: Using the Mayan Numeration System

Write  as a Hindu-Arabic numeral.

Solution: The given Mayan numeral has four places. From top to bottom, the place values are 7200, 360, 20, and 1. Represent the numeral in each row as a familiar Hindu-Arabic numeral.

Mayan numeral	Hindu-Arabic numeral	Place value
	= 14	× 7200 = 100,800
	= 0	× 360 = 0
	= 7	× 20 = 140
	= 12	× 1 = 12
		<hr/> 100,952

Multiply each Hindu-Arabic numeral by its respective place value.

Find the sum of these products.
